

Archimedes Lab

$$N/kg = m/s^2$$

Water:

$$r = .95 \text{ cm}$$

$$d = 1.4 \text{ cm}$$

$$1. \text{ slope} = .03 \text{ N/cm}$$

$$\frac{.03 \text{ N}}{1 \text{ cm}} \times \frac{100 \text{ cm}}{1 \text{ m}} = 3 \text{ N/m}$$

$$2. 3 \text{ N/m} = 9.8 (2.84 \times 10^{-4}) \varphi$$

$$\varphi = 1077.89 \text{ kg/m}^3$$

$$3. \frac{1077.9 \text{ kg/m}^3}{1000 \text{ kg/m}^3} \times 100 = 7.79\% \text{ error}$$

Oil:

$$r = 1.25 \text{ cm} = .0125 \text{ m}$$

$$d = 2.5 \text{ cm}$$

$$\pi r^2 = 4.91 \times 10^{-4}$$

$$1. \text{ slope} = .046 \text{ N/cm} \cdot \frac{100 \text{ cm}}{1 \text{ m}} = 4.6 \text{ N/m}$$

$$2. 4.6 \text{ N/m} = g(A) \varphi$$

$$\frac{4.6 \text{ N/m}}{\frac{9.8}{4.91 \times 10^{-4} \text{ m}^2}} = \varphi = 956.23 \text{ kg/m}^3$$

$$3. \frac{956.23 \text{ kg/m}^3 - 910 \text{ kg/m}^3}{910 \text{ kg/m}^3} \times 100 = 5.08\% \text{ error}$$

Wood:

$$M_{\text{small}} = 129.8 \text{ g}$$

$$V = 129.43 \text{ cm}^3$$

$$\frac{6.8}{7.0} \text{ submerged } \varphi = 1 \text{ g/cm}^3$$

$$M_{\text{large}} = 163.2 \text{ g}$$

$$V = 213.75 \text{ cm}^3$$

$$\frac{2.95}{3.8} \text{ submerged } \varphi = .76 \text{ g/cm}^3$$

$$\varphi_{\text{small}} = \frac{m}{V} = \frac{129.8 \text{ g}}{129.43 \text{ cm}^3} = 1 \text{ g/cm}^3$$

$$\varphi_{\text{large}} = \frac{m}{V} = \frac{163.2 \text{ g}}{213.75 \text{ cm}^3} = .76 \text{ g/cm}^3$$

Discussion Q's :

1. The sub fills itself with water to dive under, then releases to surface

2. No, the surface of the wood submerged would have the same volume, but the height submerged would be different

3. No, because even though the volume of the log will change, the amount displaced and the density wouldn't change.

$$4. F_b = 2.8 - 1.9 = .9 \text{ kg}$$

$2700 \text{ kg/m}^3 = 2.8 \text{ kg} / V \quad V = .001 \text{ m}^3 \quad \frac{.9 \text{ kg}}{.001 \text{ m}^3} = 900 \text{ kg/m}^3$

$$b) \frac{m_o}{V_o} = \frac{F_b}{V_o}$$

5. Yes they may not have the same mass but, if submerged at the same height each will displace the same
